

Information Services for Mathematical Research Data

ACA 2016

22nd Conference on Applications on Computer Algebra

Session: Information services for mathematics,
services, models, and data

Agenda

- Why such a session on ACA?
- What is mathematical research data?
- CAS Directories (Software)
- The concepts behind swMATH (I): The publication-based approach
- The concepts behind swMATH (II): The Web Archives approach
- Summary

Why this session on the ACA?

Currently, the subject "research data" is a hype in the discussion of scientific infrastructure?

- It would be carrying owls to Athens in this auditorium to make the statement that research results can't be reduced to the content of publications.

Some further more or less platitudes:

- The spectrum of research data has broadened within the computer age.
- Research data are depending on the science.
- Research results cannot be evaluated, repeated or reused without research data.
- Libraries are a powerful provider for maintaining the scientific literature, but information on and maintaining research data is a new challenge.

Do we need an e-infrastructure for our information? How should such a infrastructure be designed

Mathematical Research Data

Also the Symbolic Computation community (mathematical community) has - up to now - no general approach to handle the whole set of mathematical research data.

What is research data (in mathematics)?

"Research data (in mathematics) is data that is collected, observed, (used), or created, for purposes of analysis to produce original research results (in mathematics)."

(Boston University, Library)

What is mathematical research data? A (very rough) landscape

"Non-classical" mathematical research data

- Mathematical software (code)
- Related data
 - Documentations
 - Programming languages or environments
 - Benchmarks and test data
 - Data formats
 - Simulations and visualisations
 - Services (Repositories, Directories, ...)
 - ...

"Classical" mathematical research data

- Publications:
 - Mathematics models
 - Mathematical terminology
 - Mathematical theories
 - Proofs
 - Algorithms
 - Data
 - Visualizations
 - ...

Research data and Symbolic Computation

Symbolic Computation Resources:

- CAS Systems
- Services for CAS Systems (SIGSAM, CA Fachgruppe, Wikipedia, swMATH, ...)
- CAS Data and CAS Models
- Services for CAS Data and CAS Models (Symbolic Data, benchmarks, ...)
- (more general): Virtual Research Environments (OpenDreamKit)
- ...

Development of a suitable infrastructure for Symbolic Computation is not-trivial

It requires the cooperation between the Symbolic Computation community and information experts in this field (~ Mathematical Knowledge Management Initiative)

https://en.wikipedia.org/wiki/Mathematical_knowledge_management

Services for CAS Systems State of the art

- no comprehensive repository for CAS Systems
- but directories for CAS Systems support searching CAS Systems
 - SIGSAM
 - CA Fachgruppe
 - Wikipedia
 - swMATH (focused on software)
 - Symbolic Data (general information about symbolic computation, software plus data)
 - ...

Computer Algebra Software

SIGSAM maintains this collection of references to computer algebra systems, to support our [citation policy](#). Click the name of each system to see further information, links and a citation in BibTeX format. If you have suggestions for changes or additions to this list please contact Infodir_SIGSAM@acm.org.

General purpose commercial systems

- [Maple](#)
- [Mathematica](#)
- [Magma](#)

SIGSAM → Resources → Software
<http://www.sigsam.org/Resources/Software.html>

Broad purpose *free* computer algebra systems

- [Axiom](#): a general-purpose, strongly typed, computer algebra system.
- [CoCoA](#): a computer algebra system for doing computations in Commutative Algebra.
- [Fermat](#): a computer algebra system oriented towards polynomial and matrix algebra over the rationals and finite fields.
- [GAP](#): a System for Computational Discrete Algebra.
- [KASH/KANT](#): computer algebra system for sophisticated computations in algebraic number fields and global function fields.
- [Macaulay2](#): a system for research in algebraic geometry and commutative algebra.
- [Reduce](#): an interactive system for general algebraic computations of interest to mathematicians, scientists and engineers.
- [SageMath](#): an open-source general purpose computer algebra system.
- [SINGULAR](#): a Computer Algebra System for polynomial computations with special emphasis on the needs of commutative algebra, algebraic geometry, and singularity theory.
- [PARI/GP](#): a computer algebra system designed for for fast computations in number theory.

Special Purpose Systems, Packages and Libraries

- [ACE](#) : a Maple library providing tools useful in algebraic combinatorics.
- [Albert](#): an interactive program to assist the specialist in the study of nonassociative algebras.
- [ANUNQ](#): a GAP package for the computation of nilpotent factor groups of finitely presented groups.
- [ANUPQ](#): an interactive interface to the p-quotient, p-group generation and standard presentation algorithms of the ANU pq C program.
- [CALL](#): a REDUCE package for computational commutative algebra.
- [CASA](#): a Computer Algebra System for Algebraic Geometry.
- [CHEVIE](#): a computer algebra system for symbolic calculations with generic character tables of groups.
- [EinS](#): a Mathematica package allowing one to perform symbolic calculations with indexed objects.
- [Felix](#): a special computer algebra system for the computation in commutative and non-commutative rings and modules.
- [FeynArts](#): a Mathematica package for the generation and visualization of Feynman diagrams and amplitudes.
- [GiNaC](#): a system to allow the creation of integrated systems that embed symbolic manipulations together with more established areas of computer science.
- [GRAPE](#): a GAP package for constructing and analysing graphs related to groups, finite geometries, and designs.
- [GUAVA](#): a GAP package for computing with error-correcting codes.
- [LiDIA](#): A C++ Library For Computational Number Theory.
- [LiE](#): A Computer algebra package for Lie group computations.
- [MOLGEN](#): a system for the computation of all structural formulae that correspond to a given molecular formula.
- [ORME](#): a package for equational theoreies.
- [SONATA](#): a system for the construction and the analysis of finite nearrings.

List of computer algebra systems

From Wikipedia, the free encyclopedia

The following tables provide a **comparison of computer algebra systems** (CAS).^{[1][2][3]} A CAS is a package comprising a set of algorithms for performing symbolic manipulations on algebraic objects, a language to implement them, and an environment in which to use the language.^{[4][5]} A CAS may include a user interface and graphics capability; and to be effective may require a large library of algorithms, efficient data structures and a fast kernel.^[6]

Wikipedia → list of computer algebra systems (II)
https://en.wikipedia.org/wiki/List_of_computer_algebra_systems

Some problems

- › No standardized structure
The existing directories differ in structure and content. The information in SIGSAM and CA Fachgruppe restricts oneself to information on the software product, Wikipedia has also some information about version.
- › No standardized metadata scheme
The directories lists different metadata of a CAS System. More standardized information would be better but requires a higher effort.
- › Maintenance
The presented list are maintained manually. For more information about version and content the effort increases dramatically.

swMATH: The publication-based approach

swMATH is an approach for a comprehensive directory on mathematical software. basing on the close connection between publications and research data:

- (Mathematical) publications cite a (mathematical) software used.
- Hence, publications can be used to identification for software.
- The information of the publication provides a lot of relevant information
- about a software.

Unfortunately, software citations are very rudimentary, in the most cases they contain not more than the name of the software:

Böhm, Janko; Decker, Wolfram; Keicher, Simon; Ren, Yue

Current challenges in developing open source computer algebra systems. (English) Zbl 06585009

Kotsireas, Ilias S. (ed.) et al., *Mathematical aspects of computer and information sciences. 6th international conference, MACIS 2015, Berlin, Germany, November 11–13, 2015. Revised selected papers.* Cham: Springer (ISBN 978-3-319-32858-4/pbk; 978-3-319-32859-1/ebook). *Lecture Notes in Computer Science* 9582, 3-24 (2016).

Summary: This note is based on the plenary talk given by the second author at MACIS 2015, the Sixth International Conference on Mathematical Aspects of Computer and Information Sciences. Motivated by some of the work done within the Priority Programme SPP 1489 of the German Research Council DFG, we discuss a number of current challenges in the development of Open Source computer algebra systems. The main focus is on algebraic geometry and the system Singular.

Identification of mathematical software

We use some heuristic methods (searching for characteristic phrases such software/package/module/...) in connection with a name/artificial word in the zbMATH entries. The heuristic methods work surprisingly well.

but:

- Not all software can be identified.
- Most entries are really mathematical software but some belong to other classes of mathematical research data.

Of course, the publication-based approach is limited: Currently we don't get information about versions. But this information is necessary for the verification of research results and reuse of methods.

What can we do?

Development of a citation standard

A citation standard which describes exactly the used software would be a smart and fundamental solution of the problem.

A citation standard for software is discussed intensively in the Web for a long time.

A good summary about the existing practice is the blog of Mike Jackson:
<http://www.software.ac.uk/how-cite-and-describe-software?mpw>

Citation standard for software (I)

Moreover, he gives some recommendations. He distinguishes four scenarios:

Software purchased off-the shelf

ProductName. **Version**. **Release Date**. Publisher. **Location**

Software downloaded from the web

ProductName. **Version**. **ReleaseDate**. Publisher. **Location (DOI or URL)**.

DownloadDate

Software checked-out from a public repository

ProductName. (**Version**). Publisher. **CheckoutDate**. (**Location (URL Repository)**). **RepositorySpecificCheckoutInformation**

Software provided by a researcher

ProductName. (**Version**). Publisher. **Location**. **ContactDetails**.
ReceivedDate

Citation standard for software (II)

An agreement on such a standard model would allow a precise identification of the used software.

The next step would be the implementation: In LaTeX, the BibLaTeX/Biber framework can be used. It allows the definition of arbitrary types and their corresponding features

The data model is defined in BibLaTeX in the *.dbx file.

There are some further configuration files, e.g. for the output.)

A first prototypic implementation is shown on the next slide.

The prototype: A configuration file and the resulting page

```
\ProvidesFile{swmath.dbx}

\DeclareDatamodelEntrytypes{swmath}

\DeclareDatamodelEntryfields[swmath]{
  author,
  prodname,
  creator,
  maintainer,
  version,
  releasedate,
  year,
  provider,
  publisher,
  location,
  doi,
  url,
  downloaddate}

\DeclareDatamodelFields[type=list, datatype=literal]{prodname}
\DeclareDatamodelFields[type=list, datatype=name]{creator}
\DeclareDatamodelFields[type=list, datatype=name]{maintainer}
\DeclareDatamodelFields[type=list, datatype=literal]{version}
\DeclareDatamodelFields[type=field, datatype=literal]{releasedate}
\DeclareDatamodelFields[type=field, datatype=literal]{year}
%\DeclareDatamodelFields[type=field, datatype=verbatim]{publisher}
\DeclareDatamodelFields[type=field, datatype=verbatim]{provider}
\DeclareDatamodelFields[type=list, datatype=verbatim]{location}
\DeclareDatamodelFields[type=list, datatype=verbatim]{doi}
\DeclareDatamodelFields[type=list, datatype=literal]{note}
\DeclareDatamodelFields[type=list, datatype=verbatim]{downloaddate}
\endinput
```

environment which was developed at Bell Laboratories (formerly AT&T, now Lucent Technologies) by John Chambers and colleagues. R can be considered as a different implementation of S. There are some important differences, but much code written for S runs unaltered under R. R provides a wide variety of statistical (linear and nonlinear modelling, classical statistical tests, time-series analysis, classification, clustering, ...) and graphical techniques, and is highly extensible. The S language is often the vehicle of choice for research in statistical methodology, and R provides an Open Source route to participation in that activity. One of R's strengths is the ease with which well-designed publication-quality plots can be produced, including mathematical symbols and formulae where needed. Great care has been taken over the defaults for the minor design choices in graphics, but the user retains full control. R is the base for many R packages listed in <https://cran.r-project.org/>

Another solution: Web Archives

The establishment of a BibLaTeX citation standard requires time (I hope, that some communities as the CAS community could play a pioneering role).

What can we do in the meantime?

We could use Web Archives to find out more information on a mathematical software (the method will be explained later).

Analysis of information from the publication-based approach

A lot of the software packages listed in swMATH is referenced in more than one publication.

This allows a lot of conclusions

- › What are the mathematical subjects of the software? (description, keywords and MSC codes)
- › What are the most important application areas? (keyword and MSC codes)
- › How is the acceptance of the software? (number of references)
- › What is related (similar) software? (citations plus MSC code)
- › Is the software outdated? (citation profile)
- › ...

The number of references is also an (heuristic) indicator for the quality, the subjects and the number of references for the granularity, ...

A lot of open questions, e.g., How can we classify the type of the swMATH entries with the aid of publications?

Enhancement of information in swMATH

by using Internet resources, for CAS especially

- › search engines
- › websites of a software
- › mathematical software journals
- › Web Archives

to

- › identify a URL of websites and the source code of a software
- › get more specific information about the available information of a software, especially source code, versions, documentations, authors, license conditions, and further context information (e.g. publications, algorithms, test data, ...)

Web Archives

- Archiving of (selected) web sites with the goal to have a consistent state at any time (This cannot always be achieved).
- Alternative to existing web archives: archiving on demand, e.g. to ensure a consistent state among all information of the software
- Allows preserving descriptions, change logs, documentation, ...
 - Source code in case of open source software
 - Even binaries if freely available on the web
 - The website where bought / downloaded the artifact
- Even external resources, such as discussions on forums, tutorials, etc

Web Archives

- Challenges
 - Not all pages archived at the exact same time / state / version
 - Mathematical software and its related websites not always easy to discover
(the list of swMATH resources was used as a seed list)
- Questions
 - How well do websites represent software?
 - What does the web tell us about software?
 - What has already been archived?
 - What can we recover from the past?
 - What are we losing?

The experiments were done by Helge Holzmann (L3S), a cooperation partner of swMATH.

An example: The Singular website of swMATH

The screenshot displays the swMATH website interface for the Singular software. The top navigation bar includes links for 'About & Contact', 'Feedback', 'Contribute', 'Help', and 'zbMATH'. A search bar is present with options for 'Search', 'Advanced search', and 'Browse'. The main content area is divided into several sections:

- SINGULAR**: A detailed description of the Singular Computer Algebra System (CAS) for polynomial computations, including its main computational objects (ideals and modules) and various algorithms like Groebner bases, primary decomposition, and syzygy computation.
- URL: www.singular.uni-kl.de**: A prominent red box highlights the official website URL.
- Keywords for this software**: A word cloud of related terms such as 'Singular', 'Groebner basis', 'matrix factorizations', 'Milnor number', 'decomposition', 'polynomial ring', 'polynomial system', 'linearizability', and 'standard basis'.
- References in zbMATH**: A list of 20 academic references, including works by Biviá-Ausina, Botbol, Dimca, Dumnicki, Ellis, Eröcal, Ferčec, Giesbrecht, Giné, Ma, Rollenske, Adamus, Atzal, Albert, and Balekrocau.
- MSC classification**: A list of top MSC classes, including '13 Commutative algebra', '14 Algebraic geometry', '32 Functions of several...', and '68 Computer science'.
- Publication year**: A bar chart showing the distribution of publications from 1991 to 2016, with a significant increase starting around 2005.
- Chart: cumulative / absolute**: A line graph showing the cumulative number of publications over time.

At the bottom, there are links for 'Terms & Conditions' and 'Imprint'.

An example: Analysis of the archived websites (by some heuristics)

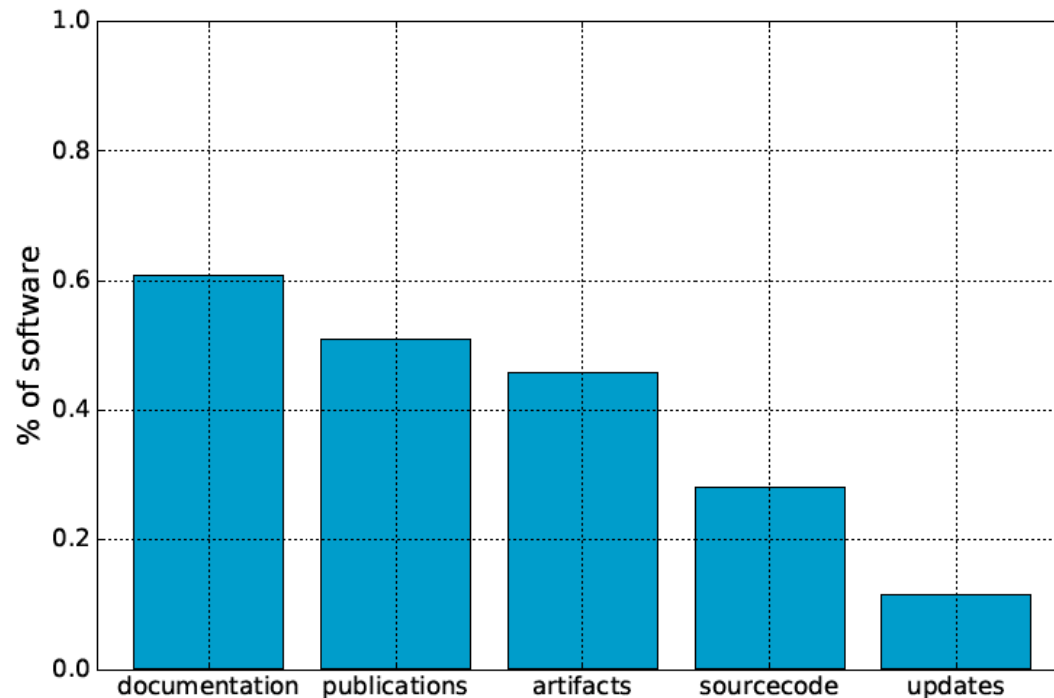

The image shows a screenshot of the Singular website. The URL in the browser is <http://www.singular.uni-kl.de/index.php/singular-manual.html>. A blue arrow points from the 'Online Manual' link in the top navigation bar to the URL. A white box with a red border is overlaid on the page, containing a list of tokens extracted from the URL. The tokens are: http, www, singular, uni, kl, de, index, php, singular, manual, and html. A red stamp with the word 'manual' is placed over the list. The website's main navigation bar includes links for 'Download 4-0-2', 'Try Online', 'Online Manual', 'Get Help', 'Report Bug', 'Books', 'Teams', and 'Join Us'. The left sidebar contains sections for 'MAIN', 'COMMUNITY', 'SYSTEM', and 'MISC'. The footer includes 'Algorithmic and Experimental Methods' and 'Funding', 'Jenks Prize', 'History', and 'Acknowledgements'.

<http://www.singular.uni-kl.de/index.php/singular-manual.html>

- Tokenization
 - ~~http~~
 - ~~www~~
 - *singular*
 - *uni*
 - *kl*

Gnuplot is a portable command-line driven graphing utility for Linux, OS/2, MS Windows, OS/2, VMS, and many other platforms. The source code is copyrighted but freely distributed (i.e., you don't have to pay for it). It was originally created to allow scientists and students to visualize mathematical functions and data interactively, but has grown to support many non-interactive uses such as web scripting. It is also used as a plotting engine by third-party applications like Octave. Gnuplot has been supported and under active development since 1986.

Gnuplot supports many different types of 2D and 3D plots
Please see demos [here](#).

Gnuplot supports many different types of output

interactive screen display:	cross-platform (Qt, wxWidgets, x11) or system-specific (MS Windows, OS/2)
static screen display:	system-specific (OSX(aqua), svga, ...)
direct output to file:	postscript (including eps), pdf, png, gif, jpeg, LaTeX, metafont, emf, svg, ...
mouseable web display formats:	HTML5, svg

Conclusions and an invitation for cooperation

Information services are part of the scientific infrastructure

Information services are an important part of the scientific infrastructure. Up to now, a comprehensive concept for the information infrastructure is missing.

The Web provides new opportunities

New concepts from the knowledge management allow the build up and maintain a suitable scientific infrastructure in an efficient way.

But we need your feedback!

The development of a powerful information infrastructure requires the cooperation of the scientific community and experts in information sciences.

Thank you for your patience!
